

MEDICINA

Področje: 3.07 Metabolne in hormonske motnje

Raziskave s področja metabolne in hormonske motnje (3.07) so v porastu, prav tako njihova odmevnost (graf 1 in 2). Na našem področju združujejo različne klinične ustanove, trdne so tudi povezave klinika – predklinika. Mednarodno sodelovanje pa je tako v sklopu Evrope kot tudi z ameriškimi institucijami.

Abstract

Genetic factors influencing the pathogenesis of osteoporosis are still largely unknown. We employed genome-wide gene expression approach in order to discover novel genes involved in the pathogenesis of osteoporosis.Further **biostatistical analysis of the microarray data by gene set enrichment analysis suggested oxidative stress may have an important part in the pathogenesis of osteoporosis**. Thus, secondly, we tested it by an in vitro assay on human **osteosarcoma cell line** cells treated with hydrogen peroxide. **After 72 h of treatment with 500 µM hydrogen peroxide, the upregulation of the same genes involved in the response to oxidative stress as on the microarrays was observed:** MT1G (metallothionein 1G, 22.1-fold, $p < 0.05$), TXNRD1 (thioredoxin reductase 1, 3.7-fold, $p < 0.05$), AOX1 (aldehyde oxidase 1, 24.5-fold, $p < 0.05$) and GSR (glutathione reductase, 4.7-fold, $p < 0.05$). Our results present a novel list of genes and metabolic pathways that may be associated with the pathogenesis of osteoporosis.

V patogenezi nastanka osteoporoze je prevladovala "estrogen – centric" teorija, ki je pripisovala padcu estrogenov po menopavzi osrednjo vlogo v patogenezi te "tihe" bolezni, ki s staranjem prebivalstva predstavlja vse večji svetovni problem¹. Šele v zadnjih nekaj letih so rezultati raziskav na podganah privedli do spoznanja, da je oksidativni stres (ali pomanjkljiva obramba pred njim) verjetno enako ali še bolj pomemben pri nastanku osteoporoze kot padec estrogenov². Pričujoči prispevek slovenskih avtorjev je med prvimi v svetu, kjer so rezultati na humani populaciji v skladu s to teorijo.
